

WOODS

RF BONDING FOR WOOD

STAIRCASE COMPONENT LAMINATION

The WOODS range of RF laminators can greatly enhance the production of staircase components. The practical design and operational simplicity of the laminators make them an ideal tool for bonding the many diverse components used in staircase manufacturing, in both hardwood and softwood.

Traditional bonding methods make batch production necessary. The WOODS range of laminators all incorporate a simple touch-screen program selector, allowing the operator the ability to change the machine characteristics from bonding hardwood newel posts to softwood winders and back again after each individual pressing - all at the touch of a button.

The unique conveyor feed design simplifies the production of over-size panels and does away with the time consuming task of cleaning off excess glue - a quick wipe over with a damp cloth is all that is needed.

The high capacity RF curing is fully automated, altering it's power output and time cycle to suit the specific load. A full load can be cured in as little as one minute, producing a fully structurally sound bond with no need for comb jointing or biscuits.
